Land biogeochemistry in CESM?

Why?

How?

"Bretherton diagram" showing the concept of an Earth System Model

Full-Form Earth System Models: Coupled Carbon-Climate Interaction Experiment (the "Flying Leap")

by Inez Fung, Peter Rayner, and Pierre Friedlingstein; Edited by Dork Sahagian

IGBP Newsletter, May 2000. The flying leap proposal was to make atmospheric CO2 a prognostic variable in climate models du

NCAR and CESM were key players in the development of the concept and creation of the first coupled carbon cycle models through the "Flying Leap" experiment (which led to C4MIP experiments).

- + Coupled C-N biogeochemistry, CESMI
- + Explicit crop management, CESM2

Every tonne of CO_2 emissions adds to global warming

°C

Global surface temperature increase since 1850-1900 ($^{\circ}$ C) as a function of cumulative CO₂ emissions (GtCO₂)

Slide from A. Swann, BGCWG

Transient fertilizer and irrigation (1850-2100) 1850 fertilizer assumed to be from manure only

NCAR CESM Workshop

Where do parameterizations come from?

I. Laboratory understanding: of plant physiological processes

e.g., Photosynthesis is co-limited by: light, energy, export of sugars

2. Empirical relationships: From as large a sample of the real world as possible

e.g., TRY Database (Leaf N and dark respiration)

3. Optimality theory: plants are rational actors, on average

e.g., FUN and LUNA modules

CTSM & MIMICS

Functional traits and the global C cycle

We consider biology above ground and at sea, what about in the world beneath our feet?

How do ecosystem function and vulnerabilities transform under climate change?

- Community Terrestrial Systems Model: Land model used for climate change and weather predictions that can be run at single points (~ I ha) to global scale.
- Hillslope Hydrology: Considers effects of aspect, elevation, and hydrologic connectivity on water availability (feature within CTSM).
- FATES: Represents vegetation demographics, traits, and recovery from disturbance (feature within CTSM).
- **MIMICS**: Soil biogeochemistry model (explicitly represent microbial activity and physiological diversity).
